This talk will be helpful for studies in which multiple persons are assessed at several time points. The idea is to identify prototypical temporal trajectories in the population from which these persons are drawn as well as, possibly, factors that predict the prototypical temporal trajectory to which a particular person is most likely to belong. In a substance abuse context, for instance, the prototypical temporal trajectories might correspond to groups of non-users, experimental users, and escalating users.

Please RSVP to Ms. Johanna Wray (jst227@uky.edu) as seating is limited.
