What should I bring to my first consultation?

Here are some suggestions to help you prepare for the initial meeting. Note that these may or may not be applicable to your specific request.

a. Come prepared to describe your study design (either how you did your study or what you plan to do).

b. Define at least one testable hypothesis for each specific aim of your study.

c. For the purpose of determining an estimated sample size we will need at least one primary endpoint identified. For that endpoint we will need to know:
   i. The anticipated mean response and standard deviation of the endpoint in the control arm.
   ii. The expected change in the primary endpoint in the study arm.
