

Do Specific Gene Variants Cause Inflammation in Cells?

Researchers at the University of Kentucky are inviting you to participate in a research study to see if different types of a gene cause immune cells to become activated. We hope to better understand how naturally occurring gene variations impact immune activity. Participants in this study will be sent a cheek swab kit in the mail to self-administer and send back in a prepaid envelope. All information will be confidential and participants will be compensated for their help.

You may be eligible to participate if you are age 18 or older.
