Abstract Title:	The Impact of Early Adversary on Lifetime Learning: An Evaluation of Adverse Childhood Experiences (ACEs) and Their Correlation with Risk of Childhood Developmental, Social, or Behavioral Delays in Children Ages 1-5 in the U.S.	
Author(s):	R. Brase, College of Public Health, U of Kentucky S. Cprek, College of Public Health, U of Kentucky C. M. Williams, College of Public Health, U of Kentucky	
numerous and and subsequer ACE score and and the risk of 5 years in the l child's risk of b 2011/2012. An most common (41.9%). The p A dose respon- experienced no 42.2% risk of d delay in childre	kground: The negative health outcomes associated with Adverse Childhood Experiences (ACE) are well documented. So too is the importance of the first five years on a child's brain development, ht life. However, there is a paucity of literature assessing the relationship between a child's overall t that child's risk for early delay. Objective: Evaluate the association between overall ACE Score developmental, social, or behavioral delay in a nationally representative sample of children ages 1- JS. Methods: This study evaluates cross-sectional data on children's overall ACE score and the eing developmentally, socially, and behaviorally delay from the National Survey of Child's Health alysis (chi-square and multiple logistic regression) was completed in SPSS. Results: The three ACEs reported were racial injustice (44.3%), parental death (43.8%), and neighborhood violence resence of any ACE was found to be associated with a 30.4% increased risk of delay for children. se relationship was also found between number of ACEs and risk of delay with children who o ACEs reporting a 24.4% risk compared to those who experienced four or more ACEs reporting a lelay. Conclusion/Implications: There is a strong positive relationship between ACEs and the risk of en. These results suggest assessing and addressing ACEs in early childhood could have a positive cing the long-term negative health effects of early developmental, social, and behavioral delays.

Abstract Title:	Pseudomonas Aeruginosa Impact on Severity of Bronchiectasis
	R. Choate, Dept. of Preventive Medicine & Environmental Health, U of Kentucky
	D. M. Mannino, Dept. of Internal Medicine, U of Kentucky
Author(s):	T. Aksamit, Pulmonary Disease & Critical Care Medicine, Mayo Clinic, Rochester, Minnesota
	Bronchiectasis and NTM Research Registry Consortium
	G. Stone, Grifols
	kground: Bronchiectasis is a disease characterized by dilated bronchi leading to mucus collection
	nfections of the airways. Pseudomonas Aeruginosa (PA) is one of the most frequently isolated
	putum of patients with bronchiectasis and some other chronic pulmonary diseases. Objective: The
	is study were to estimate the prevalence of PA in non-CF bronchiectasis patients and to determine
	nt impact of PA on hospital admissions, exacerbations, lung function and severity of bronchiectasis. study used baseline data from the Bronchiectasis and NTM Research Registry (BRR). Modified
	Severity Score (BSI) and modified FACED were used to categorize the severity of bronchiectasis.
	n the groups were compared using t-test/ANOVA or Wilcoxon-Mann-Whitney for continuous
	Chi-square for categorical variables. Statistical analyses were carried out using SAS 9.4. Results:
	er of the patients (24.1%) had one or more bacterial cultures positive for PA. A higher proportion of
	A reported having pulmonary exacerbations and had a greater average number of hospital
	the past two years compared to PA-negative patients (p<.0001). There was significant impact of PA
	n in patients with bronchiectasis. PA-positive patients had significantly greater proportion of high
	.0%) compared to PA-negatives (29.5%) (p<.0001), and had severe bronchiectasis on FACED.
Conclusions: C	Our study found estimated prevalence of PA in non-CF bronchiectasis patients of 24.1% in the BRR.
PA-positive pat	tients had significantly greater average number of exacerbations and hospitalizations, and higher
	nd FACED scores. Further research is recommended to better understand the impact of PA on
outcomes in pa	atients with bronchiectasis.

Abstract Title:	Feasibility and Acceptability of the Family Check-Up for Parents of Deaf and Hard of Hearing Children
	A. S. Merritt, Dept of Health, Behavior & Society, College of Public Health, U of Kentucky
Author(s):	J. A. Jacobs, Dept of Health, Behavior & Society, College of Public Health, U of Kentucky
	M. L. Bush, Dept of Otolaryngology - Head & Neck Surgery, College of Medicine, U of Kentucky
	C. R. Studts, Department of Health, Behavior & Society, College of Public Health, U of Kentucky
	roximately 20% of preschool-aged children exhibit clinically significant disruptive behaviors, but
	hard of hearing (DHH) children, the prevalence increases to nearly 50%. Disruptive behaviors in
	can develop into more serious delinquent behaviors such as bullying, physical aggression,
	ubstance abuse if left untreated. The purpose of this study was to examine the feasibility,
	and initial outcomes of an off-the-shelf parent training program when delivered to parents of DHH
preschoolers.	In this pilot randomized controlled trial, parents randomized to the intervention group met with a
trained interve	ntionist who delivered 3 sessions of the Family Check-Up. Those randomized to the wait-list control
group received	3 sessions of a didactic general wellness curriculum. Of 12 enrolled families, 11 completed all
study procedu	res. The intervention parents were highly satisfied with the Family Check-Up (mean satisfaction
score = 4.4 of	5). From baseline to post-intervention, 4 of the 6 intervention parents reported decreases in
depressive syr	nptoms. Similarly, 4 of 6 intervention parents showed increases in parenting satisfaction, parenting
	nd perceived impact on the family of child behaviors, which are all associated with positive
	aviors. In contrast, most wait-list control parents' scores on these variables remained stable or
	a proof-of-concept demonstration, this study suggests that moderately positive outcomes may be
	an intervention using as few as 3 visits. These outcomes are encouraging but demonstrate the
	ations to make the Family Check-Up more relevant for parents of DHH young children.

Abstract Title:	Exploring the Spatial Relationship Between Hospital Readmissions and Obesity in Kentucky Counties.
Author(s):	T. R. Williams, College of Public Health, U of Kentucky W. J. Christian, College of Public Health, U of Kentucky
similar to the p serious health after discharge study's objective the same areas software was u conducted using serving as the discharge serving rates. Results: the eastern (RF region was also regions in Kent elucidate the m	kground and Purpose: In 2015, approximately one-third of adults in Kentucky were obese, which is roportion of obese adults nationwide. People who are obese have an increased risk of other conditions that often result in lengthy and frequent hospital stays. Readmissions to hospitals soon are recognized as an expensive, largely preventable source of Medicare expenditures. This ve was to determine if high hospital readmission rates amongst Medicare beneficiaries occurred in s of Kentucky as high obesity rates. Methods: Geographic information system (GIS) and SatScan used to explore spatial patterns of hospital readmissions in Kentucky. Spatial scan analysis was ng a discrete Poisson model with the total number of hospitalizations for Medicare beneficiaries population and the number of Medicare beneficiaries readmitted to the hospital shortly after ing as the cases. Results of this analysis were then compared to a map of county-level obesity Significant, nonrandom clustering of high hospital readmission rates were observed in counties in R=1.71), northern (RR=1.35) and western (RR=1.13) parts of Kentucky. The cluster in the eastern of found in a cluster of counties with the highest rates of obesity in Kentucky. Conclusions: Certain tucky have higher obesity and hospital readmission rates than others. This study did not attempt to nechanisms underlying this relationship, and future research should employ techniques like multiple lays that account for other possible covariates.

Oral Presentation Preliminary Analysis of Male Attitudes Towards Reproductive Coercion Abstract Title: H. McDaniel, Department of Health, Behavior and Society, U of Kentucky C. WIlliams, Department of Health, Behavior and Society, U of Kentucky Author(s): S. Cprek, Department of Health, Behavior and Society, U of Kentucky B. Fisher, U of Cincinnati, Cincinnati, OH Abstract: Reproductive coercion (RC) can be defined as actions relating to reproductive health taken by a partner in order to maintain power and control in a relationship. While multiple studies have looked at reproductive coercion's role in unintended pregnancies and the correlation with interpersonal violence, this research has only examined the experiences of women. Further, the definition of RC has not addressed the experiences of reproductive coercion among men, though the anecdotal phenomenon of women getting pregnant to trap men is often discussed. This presentation will address the gap between collected RC data for men and women. Specifically, it will look at the questions: 1) What are the most common forms of reproductive coercion experienced by men? 2) How does previous pregnancy impact males attitudes? In a cross-sectional survey of college students from two large, public universities in 2015 (n=4,063), both men and women responded to questions relating to condom use, birth control sabotage and pregnancy discussions. During past surveys, men were either excluded or not looked at individually. Including men's experiences in the conversation about pregnancy prevention programs as well as interpersonal violence (IPV) prevention programs will help us analyze factors contributing to unintended pregnancies and IPV. As well, decreasing reporting inequalities between male and female RC experiences will open doors to a broader discussion about healthy relationships and family planning. 	L. Wong, Department of Plastic Surgery, U of Kentucky		
	H.C. Vasconez, Division of Plastic Surgery, U of Kentucky		

Abstract: Background: House Bill 1 (HB1), passed in 2012, was introduced to address the growing problem of prescription opioid abuse in Kentucky. The restrictions enacted in HB1 may have shifted the rate of addiction away from prescription opioid pills towards the less regulated, and less expensive abuse of IV drugs, resulting in increased risk of upper extremity soft tissue infections (UESTIs). The intent of this study was to assess the impact of HB1 on the rate of UESTIs among intravenous drug users (IVDU) at the authors' institution. Methods: A retrospective cohort study was conducted from 2006-2015. Adult patients aged 18-75 with UESTIs, including those with suspected IVDU, were included. The EPSi database was gueried using a combination of ICD and CPT codes associated with management. A total of 3,277 (non-IVDU n=2,913, IVDU n=364) ED visits for 2,744 unique patients were identified. Data were analyzed using Chi-square, Fisher's exact, t-tests, Mann-Whitney U, and/or Pearson's correlation. Results: IV drug-related UESTIs increased significantly from 2006 to 2015 (17 to 73, 9.4% to 18.4% of all UESTIs) (r=0.087, p<0.0001). There were 1,285 UESTIs in the pre-HB1 years (2006-2011) and 1,628 post-HB1 (2012-2015). Of those, 117 (8.3%) and 247 (13.2%) respectively, were IV drug-related (p<0.0001). Conclusion: The total number of UESTIs increased between pre-HB1 and post HB1, as did the proportion of IV drug-related cases. This may indicate an unintended consequence of HB1. We submit that restrictions enacted by HB1 shifted patterns of drug abuse towards IVDU, resulting in an increase in UESTIs at our institution.

13th Annual CCTS Spring Conference Friday April 13, 2018 Lexington Convention Center College of Public Health Research Day

Poster Presentation #257 Abstract Title: Evaluating the Association Between Atrazine and Birth Defects in Kentucky, 2005-2014 Author(s): M. D. Politis, Dept. of Epidemiology, College of Public Health, U of Kentucky Author(s): W. T. Sanderson, Dept. of Epidemiology, College of Public Health, U of Kentucky W. J. Christian, Department of Epidemiology, College of Public Health, U of Kentucky S. R. Browning, Department of Epidemiology, College of Public Health, U of Kentucky Abstract: Objective/Background: Atrazine is one of the most widely used pesticides in the United States. Studies have shown that pesticides, particularly herbicides such as atrazine, may be associated with birth defects. The purpose of this study is to evaluate the association between potential environmental exposures to atrazine in water systems and prevalence rates of birth defects for the state of Kentucky. Methods: We conducted an ecological study using the Kentucky Birth Defects Registry Surveillance (KBRS) and the Kentucky Geological Survey databases from 2005 to 2014. Cases included all live-born infants with birth defects indicated by an ICD-code. Poisson regression was used to estimate crude and adjusted rate ratios of the association between agricultural exposure metrics and birth defects. Results: There were 16,070 cases identified from the KBRS. The overall prevalence of birth defects was 32.99 per 1,000 live births. Preliminary crude data analysis showed that high mean concentrations (greater than 0.4958 µg/L) had 2.34 times the rate of genital birth defects compared to counties with low mean concentrations (less than or equal to 0.0 µg/L) (p-value: 0.008). Conclusions: This research has the potential to provide important information on atrazine conc		Concept of Fabric ficality rescaron Day

METHODS: Only full-text journal articles written in English, published in or after 1989, describing observational or experimental studies with 50 participants or more were included. RESULTS: A total of 15 studies conducted in Japan (n=1), Taiwan (n=5), and in the U.S. (n=9) were included. We found seven cohort, six cross-sectional, and two studies with both cross-sectional and cohort designs. The number of participants ranged from 865 to 1,021,049. The prevalence of HCV ranged from 0.3% to 63.8%. Median follow-up time to observe development of CKD ranged from 2.1 to 11.4 years for the cohort studies. The percentage of observed CKD ranged from 0.6% to 31.8%. Ten studies: five cohort studies (one prospective cohort from Taiwan, two retrospective cohort studies from Taiwan and two retrospective cohort studies from the U.S.) as well as five cross-sectional (one from Japan, two from Taiwan, and two from the U.S.) studies showed that individuals infected with HCV were significantly more likely to present with CKD, whereas three cross-sectional and two retrospective cohort studies from the use showed that individuals infected with HCV were significantly more likely to present with CKD, whereas three cross-sectional and two retrospective cohort studies from the U.S. found either no associations or decreased odds of development of CKD. CONCLUSION: Further research is recommended to examine the risk of CKD in multiple exposure groups categorized based on HCV viral load and/or HCV genotype.	(CKD) has not been established. OBJECTIVE: To conduct a systematic literature review of population-based studies whose aim was to find associations between HCV and risk of early onset of CKD. METHODS: Only full-text journal articles written in English, published in or after 1989, describing observational or experimental studies with 50 participants or more were included. RESULTS: A total of 15 studies conducted in Japan (n=1), Taiwan (n=5), and in the U.S. (n=9) were included. Abstract Title:	Cost-Effectiveness of Mandatory Drug Overdose Decedent Toxicology Testing in Kentucky, 2010-2016
	D. Quesinberry, Kentucky Injury Prevention and Research Center, U of Kentucky
	T. Bunn, Kentucky Injury Prevention and Research Center, U of Kentucky
Author(s):	M. Singleton, Kentucky Injury Prevention and Research Center, U of Kentucky
	C.B. Mamaril, Department of Health Management and Policy, College of Public Health, U of
Abotroot, Dool	Kentucky
	ground: In 2012, Kentucky mandated toxicology testing of post-mortem examinations to increase drug overdose death certificates that listed the specific drug(s) to improve drug overdose fatality
	The study aim was to assess the cost-effectiveness of post-mortem toxicology testing by
	cal examiners in Kentucky from 2010-2016 through changes in incremental cost-effectiveness
	Methods: The percentage of death certificates for drug overdose decedents that listed one or
	lrug(s) is dependent variable, % specificity. Drug overdose decedents whose deaths occurred from
	n=7,439) were included. Annual ICERs were calculated for the difference in costs for death
,	with testing and without testing and the difference in % specificity in cases with testing and without
	S: For 2010-2016, the average cost of drug overdose death investigations was \$16,609 per %
	nual total cost per case declined from 2010 to 2016. ICERs of death investigations including
	ng declined from a high of \$8,488 per 1% specificity in 2010 to \$1,505 per 1% specificity in 2014.
	Results suggest that mandating toxicology testing has been cost-effective in decreasing the overall
cost of drug ove	erdose death investigations in Kentucky from 2010 to 2016 primarily due to increases in the
proportion of ca	ases where coroners performed toxicology testing over requesting a full autopsy. Request for
autopsy can be	e reserved for cases where there are other possible contributing causes to the fatal drug overdose.

Abstract Title:	Understanding the Silent Crisis: An Analysis Firearm-Related Suicide among Females in Kentucky
Author(s):	 C. Rhea, College of Public Health, U of Kentucky S. Brown, College of Public Health, Department of Epidemiology, U of Kentucky M. Singleton, KIPRC, College of Public Health, Department of Biostatisitcs, U of Kentucky K. Winter, College of Public Health, Department of Epidemiology, U of Kentucky
cause of death differing from th beginning in 20 suicide compar Methods: Suici were eligible for (demographic, Kentucky fema 24% in current associated with problems are n female firearm This informatio and strategies	kground: Suicide has been called the silent crisis. With rates increasing, it is the 10th leading in the United States. Females in Kentucky die by suicide most often through the use of firearms, he national trend of poisoning. Additionally, a drastic increase in firearm suicides was observed 10. The aim of this study is to investigate why females in Kentucky are using firearms to die by red to other methods, and compare those results to similar states to understand this trend. ides reported to the National Violent Death Reporting System from Kentucky, Ohio, and Virginia r this study. Multivariate logistic regression was performed to determine which variables personal circumstance, and mental health) were related to a suicide via firearm. Results: les who die by suicide are not receiving mental health treatment, only 36% were diagnosed and treatment. Within comparison states, increased mental health diagnosis and treatment was a decreased firearm suicides. Kentucky females living in a rural county and with intimate partner hore likely to die by suicide via firearms. Conclusion: These results contribute to understanding suicide in Kentucky and guides efforts for future research and interventions to at-risk populations. In highlights mental health care with recommendations to emphasize means reduction counseling eliminate barriers to this care. Addressing the lack of mental health care appears effective in high rates of firearm suicide.

Abstract: The	UK Student Dental Clinic, a busy clinic located on the campus of the University of Kentucky,
	range of patient care while meeting the training needs of both 3rd and 4th year dental students.
	f this project was to use quality improvement tools to better understand current workflow processes
	tential areas for improvement. Data were collected using the walk-through method and
	he walk-through focused on understanding the experiences of patients scheduling appointments.
	the walk-through depicted wide variation in the current process and informed the design of
	rotocols. During the observation phase members of our team shadowed dental students as they
	nt care – from patient arrival to departure. Data collected were analyzed using process workflow
	ti diagrams and the waste-walk method. These results as well as insights from the process owners
	dentify ideas to reduce waste and standardize the scheduling process. The next phases of the
project will invo	blve collecting baseline metrics (e.g. no shows, cancellations, and incorrect appointment type) and
prioritizing imp	rovement ideas. Impact will be continually monitored through each small cycle of change with
adjustment bei	ng made as needed.
