

Could Hormones be Impacting your Child's Attention?

The RISK Lab at the University of Kentucky is conducting a research study to examine hormone levels and their potential impact on attention span among children and teens. Interested parties will be asked to complete a phone (or) online screening to determine their child's eligibility to participate. If eligible, (participants and their parent or guardian) will visit the lab to complete a 2-hour, in-person interview at the University of Kentucky.

Your Child May Be Eligible To Participate If They Are:

- between 9 - 17 years old and menstruate
- NOT taking any hormone-based medications

Participants will receive compensation for their time.
